

ABSTRACT OF THE DISCLOSURE

An imaging system comprises a client device with a display unit, a server controller, stored document information, document modification methods, an imaging device, and documents to be imaged. A user of the client device requests a particular stored document to be displayed on the display unit. The server receives the client
5 request and creates a first user interface for the user to view the stored document and to either accept or request modification to the displayed document. If the user requests modification to the displayed document, the server creates a second user interface for the user to communicate to the imaging system a desired modification to be made in the displayed document. The server determines the best means to address the
10 request, modifies the document, and stores the document information for subsequent use.
